# Using R to Estimate Animal Population Density

?

Animals

	1	2	3	4	5
1	0	1	1	0	0
2	1	0	0	0	0
3	0	0	1	0	1
4	0	1	0	1	1
5	0	0	1	0	0
6	1	0	1	0	0
7	0	0	0	1	1
8	0	1	0	1	0

Detection  
occasions

Animals

	1	2	3	4	5
1	0	1	1	0	0
2	1	0	0	0	0
3	0	0	1	0	1
4	0	1	0	1	1
5	0	0	1	0	0
6	1	0	1	0	0
7	0	0	0	1	1
8	0	1	0	1	0

Detection  
occasions

Butterfly 1 was  
detected on the  
second and third  
occasions only.

Animals

	1	2	3	4	5
1	0	1	1	0	0
2	1	0	0	0	0
3	0	0	1	0	1
4	0	1	0	1	1
5	0	0	1	0	0
6	1	0	1	0	0
7	0	0	0	1	1
8	0	1	0	1	0

Detection  
occasions

The first time we  
set up our nets,  
we only captured  
two butterflies:  
butterfly 2 and  
butterfly 6.

# Halfnormal Detection Function

$$g(d) = g_0 \exp \left( \frac{-d^2}{2\sigma^2} \right)$$

# Halfnormal Detection Function

# Detection Function Parameters: **$g_0$**

$g_0$  is the probability of trapping/detecting the animal when its distance from the trap is zero, i.e. it is the 'baseline detection probability'

Effect of  $g_0$  on Detection Function

# Detection Function Parameters: **sigma** ( $\sigma$ )

Sigma is the scale at which the detection probability decreases as the distance between the animal and the detector/trap decreases

Effect of sigma on Detection Function

# Output part 2:
